Scala

Combines Functional & Object Oriented

- Combines Functional & Object Oriented
- Interop with Java

- Combines Functional & Object Oriented
- Interop with Java
- Dynamic-like Syntax in a Static Language

- Combines Functional & Object Oriented
- Interop with Java
- Dynamic-like Syntax in a Static Language
- Easy to start playing with (REPL)

Let's Start Variables & Classes

```
m.map { t => val (s, i) = t; (s, i+1) }
```

m.map {
$$t \Rightarrow val(s, i) = t; (s, i+1) }$$

<insert mental "record scratch" here>

Declaring a Class

```
public class Person {
    public String name;
    public Person(String name) {
        this.name = name;
    public String getName() {
     return this.name;
    public void setName(String name) {
     this.name = name;
```

class Person(var name:String)

*

```
def savePerson(p: Person): ID = {
  dao.save(p)
}
```

```
Start of
Function
Declaration

def savePerson(p: Person): ID = {
   dao.save(p)
}
```

```
Start of Function Name

def savePerson(p: Person): ID = {
   dao.save(p)
 }
```

```
Start of Function Name Name

def savePerson(p: Person): ID = {
   dao.save(p)
}
```

```
Start of Function Parameter Parameter Parameter Type

def savePerson(p: Person): ID = {
   dao.save(p)
}
```

```
Start of Function Name Parameter Name Parameter Type

def savePerson(p: Person): ID = {
    dao.save(p)
}
```

```
Start of
                                            Function
             Function
                       Parameter Parameter
 Function
                                            Return
              Name
                         Name
                                   Type
Declaration
                                             Type
  def savePerson(p: Person): ID
     dao.save(p)
                                                 Start of
                                                Function
                                                Definition
```

```
Start of Function Name Parameter Parameter Type

def savePerson(p: Person): ID = {
    dao.save(p)
  }

Start of Return Type

Start of Function Return Type

Ode SavePerson(p: Person): ID = {
    dao.save(p)
  }
```

Things to note:

- Last expression is return value
 - if more than one?
- = sign, the ; of Scala!
- : is used just like in variable declaration

Things to note:

 - while/do-while
 - for comprehensions

- The if statement, nothing new here
- Looping
 - while/do-while
 - for comprehensions
 - Higher-Order List functions (foreach)

```
List<Employee> fullTime = new ArrayList<Employee>();
for (emp : empList) {
  if (emp.status == Consts.FULL_TIME)
    fullTime.add(emp);
}
```

```
List<Employee> fullTime = new ArrayList<Employee>();
for (emp : empList) {
  if (emp.status == Consts.FULL_TIME)
    fullTime.add(emp);
}
```

```
val fullTime = new ListBuffer[Int]
for (emp <- empList) {
  if (emp.status == Consts.FULL_TIME)
    fullTime += emp
}</pre>
```

```
List<Employee> fullTime = new ArrayList<Employee>();
for (emp : empList) {
  if (emp.status == Consts.FULL_TIME)
    fullTime.add(emp);
}
```

```
val fullTime = new ListBuffer[Int]
for (emp <- empList) {
  if (emp.status == Consts.FULL_TIME)
    fullTime += emp
}</pre>
```

```
val fullTime = for (emp <- empList
   if emp.status == Consts.FULL_TIME) yield emp</pre>
```

Best described by showing Function literals

```
val add_one: (Int) => Int = (x) => x + 1
```

Best described by showing Function literals

```
val (add_one): (Int) => Int = (x) => x + 1
```

add_one)is:

Best described by showing Function literals

```
val add_one: (Int) \Rightarrow Int = (x) \Rightarrow x + 1
```

add_one is:

A function which

Best described by showing Function literals

```
val add_one: (Int) => Int = (x) => x + 1
```

add_one is:

- A function which
 - Takes a single parameter of type Int

Best described by showing Function literals

```
val add_one: (Int) => (Int) = (x) => x + 1
```

add_one is:

- A function which
 - Takes a single parameter of type Int
 - (Returns a value of Type Int

Best described by showing Function literals

```
val add_one: (Int) => Int = (x) => x + 1
```

add_one is:

- A function which
 - Takes a single parameter of type Int
 - Returns a value of Type Int
- (It's implementation is as follows)

Best described by showing Function literals

```
val add_one: (Int) => Int = (x) => x + 1
```

- add_one is:
- A function which
 - Takes a single parameter of type Int
 - Returns a value of Type Int
- It's implementation is as follows
 - (The parameter will be named x)

Best described by showing Function literals

```
val add_one: (Int) => Int = (x) => x + 1
```

add_one is:

- A function which
 - Takes a single parameter of type Int
 - Returns a value of Type Int
- It's implementation is as follows
 - The parameter will be named x

• (It will return) x + 1

Best described by showing Function literals

```
val add_one: (Int) => Int = (x) => (x + 1)
```

- add_one is:
- A function which
 - Takes a single parameter of type Int
 - Returns a value of Type Int
- It's implementation is as follows
 - The parameter will be named x
 - It will return (x + 1)

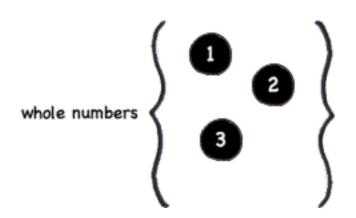

Not Map

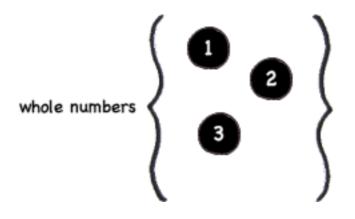

- Not Map
- A higher-order function

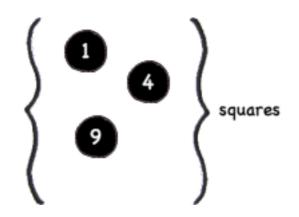

- Not Map
- A higher-order function
- Name is from Maths

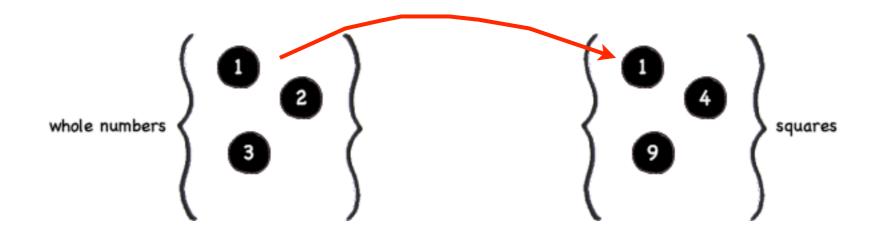

"map an element from one set to another"

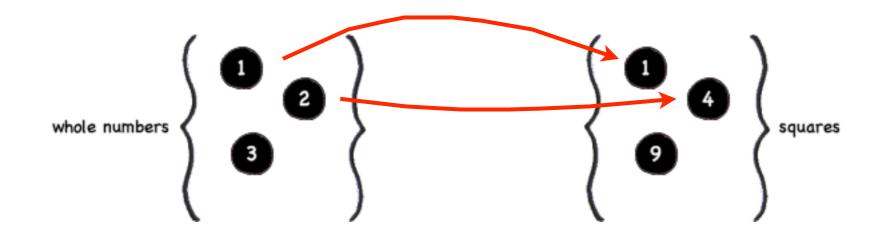

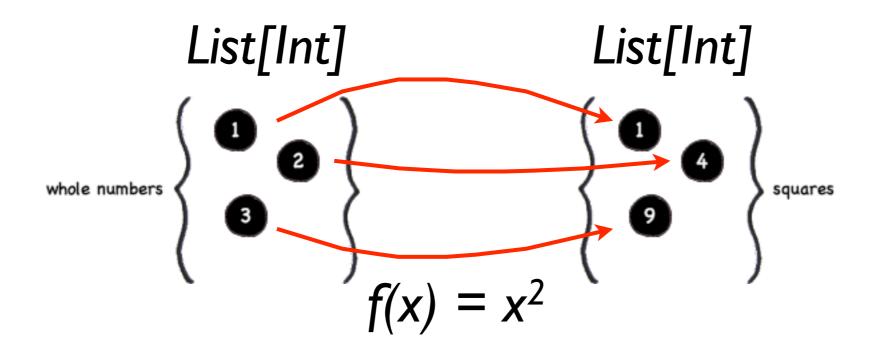

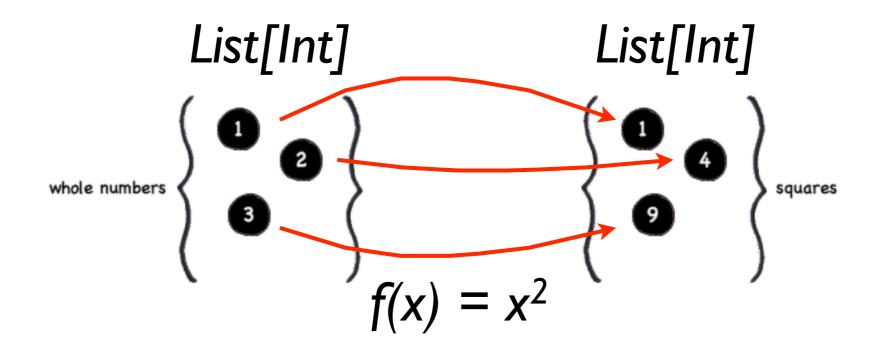

val squares = wholeNumbers map $x \Rightarrow x \times x$

*

 With Collections you begin to see the power of Higher-Order functions

- With Collections you begin to see the power of Higher-Order functions
- You start viewing Data Structures as things you work with, not on.

- With Collections you begin to see the power of Higher-Order functions
- You start viewing Data Structures as things you work with, not on.
 - You pass functions to Lists, rather than Lists to functions

Pattern Matching

 The case and match keywords are comprehenders just like for

*

- The case and match keywords are comprehenders just like for
- match comprehends Partial Functions

*

- The case and match keywords are comprehenders just like for
- match comprehends Partial Functions
- case statements generate Partial Functions

*

- The case and match keywords are comprehenders just like for
- match comprehends Partial Functions
- case statements generate Partial Functions
 - For several different types (Strings, Ints, Regular Expressions, Types, Sequences, Foo...)

*

In order to Allow:

```
var kid = Person("Mitch", "Tataryn")
kid match {
    case Person("Mitch", "Tataryn") => println("Hi Son!")
    case Person("Lilja", "Tataryn") => println("Hi Daughter!")
    case Person(_,_) => println("Who are you?")
}
```

In order to Allow:

```
var kid = Person("Mitch", "Tataryn")
kid match {
    case Person("Mitch", "Tataryn") => println("Hi Son!")
    case Person("Lilja", "Tataryn") => println("Hi Daughter!")
    case Person(_,_) => println("Who are you?")
}
```

You can do:

```
object Person {
  def unapply(p: Person): (String, String) = {
     (p.fname, p.lname)
  }
}
```

In order to Allow:

```
var kid = Person("Mitch", "Tataryn")
kid match {
    case Person("Mitch", "Tataryn") => println("Hi Son!")
    case Person("Lilja", "Tataryn") => println("Hi Daughter!")
    case Person(_,_) => println("Who are you?")
}
```

You can do:

```
object Person {
    def (unapply)(p: Person): (String, String) = {
        (p.fname, p.lname)
    }
}
```

In order to Allow:

```
var kid = Person("Mitch", "Tataryn")
kid match {
   case Person("Mitch", "Tataryn") => println("Hi Son!")
   case Person("Lilja", "Tataryn") => println("Hi Daughter!")
   case Person(_,_) => println("Who are you?")
}
```

You can do:

```
object Person {
   def unapply(p: Person): (String, String) = {
        (p.fname, p.lname)
    }
}
```

Or:

```
case class Person(fname: String, lname: String)
```

In order to Allow:

```
var kid = Person("Mitch", "Tataryn")
kid match {
   case Person("Mitch", "Tataryn") => println("Hi Son!")
   case Person("Lilja", "Tataryn") => println("Hi Daughter!")
   case Person(_,_) => println("Who are you?")
}
```

You can do:

```
object Person {
   def unapply(p: Person): (String, String) = {
        (p.fname, p.lname)
    }
}
```

Or:

```
case class Person(fname: String, lname: String)
```

The Tuple

Use a Tuple if...

Use a Tuple if...

Want to return more than one thing

*

Use a Tuple if...

- Want to return more than one thing
- Want to extract more than one thing

*

About Tuples in Scala

```
m.map { t => val (s, i) = t; (s, i+1) }
```

About Tuples in Scala

- Tuples are Fundamental
- You'll start to recognize their use everywhere

```
m.map { t => val (s, i) = t; (s, i+1) }
```

If we have Time...

Partially Applied Functions

 Allows you to "fill in a parameter" at a later time

- Allows you to "fill in a parameter" at a later time
- Useful for stating locally-scoped default parameters

- Allows you to "fill in a parameter" at a later time
- Useful for stating locally-scoped default parameters

```
def draw(widget: Widget, canv: Canvas) = ...
```

- Allows you to "fill in a parameter" at a later time
- Useful for stating locally-scoped default parameters

```
def draw(widget: Widget, canv: Canvas) = ...
.
.
.
val myDraw = draw(_, myWindow.canvas)
myDraw(myWidget)
```

Closures

Functions are usually able to access:

*

- Functions are usually able to access:
 - their parameters

*

- Functions are usually able to access:
 - their parameters
 - their enclosing/super class

*

- Functions are usually able to access:
 - their parameters
 - their enclosing/super class
- Closures add the ability to "take your scope with you"

*

Closures

Closures

```
def deferTaxCalculate(emp: Employee): () => Double = {
  val bracket = taxBracketMap(emp.salary)
  reallySlowTaxCalculator(emp, bracket)
}
```

• If you see a function call like this: geoLocate(40.827873)(85.341797)

- If you see a function call like this: geoLocate (40.827873) (85.341797)
- It was defined like this: def geoLocate(lat: Double)(lng: Double) = ...

- If you see a function call like this: geoLocate (40.827873) (85.341797)
- It was defined like this: def geoLocate(lat: Double)(lng: Double) = ...
- YouCurry non-curried functions using .curried

Implicit Functions

 Implicit functions are typically used for Type Conversion

- Implicit functions are typically used for Type Conversion
- Remember this example?

```
var str = "Hello"
str = 10 //Bzzzzt!
```

- Implicit functions are typically used for Type Conversion
- Remember this example?

```
var str = "Hello"
str = 10    //Bzzzzt!

implicit def intToString(i: Int) {
   i.toString
}
```
